The innate immune system is the body’s first line of defense against infection acting to destroy and remove anything perceived as foreign. To cause prolonged disease a pathogen must evade this defense. We are using structural methods to study pathogen systems which act to evade innate immunity in a variety of ways (i) the complement regulator acquiring surface proteins [1] of Borrelia burgdorferi (ii) complement regulatory proteins secreted in the saliva of soft ticks and (iii) the type three secretion system of Shigella flexneri [2] used to facilitate entry of the bacterium into host cells, so hiding it from the immune system. Recent data will be presented.

Keywords: complement regulation, lyme disease, shigella
