- Introduction
- Neutrons specular reflectivity study (ILL D16-D17)
with E. Bellet-Amalric, G. Fragneto, F. Graner (Grenoble),
K. Mecke (Stuttgart)
G. Fragneto et al, *Europhys. Lett.* **53** (1) 100-106 (2001).
K. Mecke et al, *Langmuir* **19** (6) 2080-2087 (2003).
- X-rays off-specular study (ESRF BM32 F. Rieutord)
with A. Braslau and J. Daillant (Paris)
J. Daillant et al, *PNAS*, **102** (33), 11639-11644 (2005).

Introduction

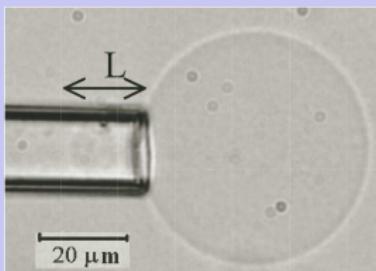

Specular reflectivity
Off-specular reflectivity

Self-assembled phospholipidic systems

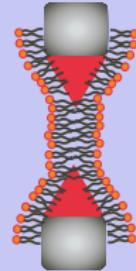

Why double bilayer ?

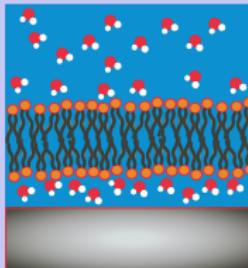

Multilamellar stack

Vesicle

Black Lipid Membrane

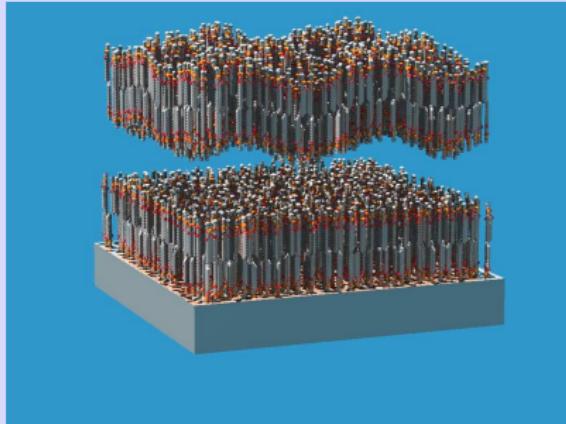

Supported bilayer

We are looking for :

- a supported membrane with controlled position :
 - to use molecular level probe as Neutrons, X-Rays, FRAP...
 - to work on a unique, accessible and non-confined bilayer
- not to strongly bound to the substrate to investigate dynamical properties

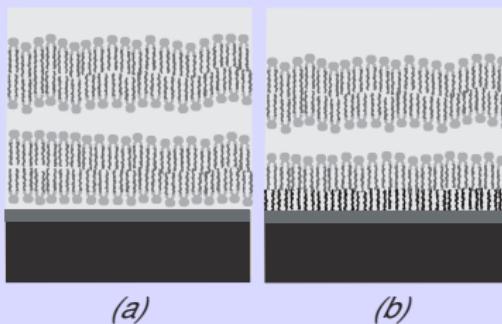

We are looking for :

Going from Gel Phase ($T < T_m$) to Fluid Phase ($T > T_m$)

- Large swelling around transition temperature T_m .
- D_w increase correlated to σ_f increase.

Large increase of thermal fluctuations ?

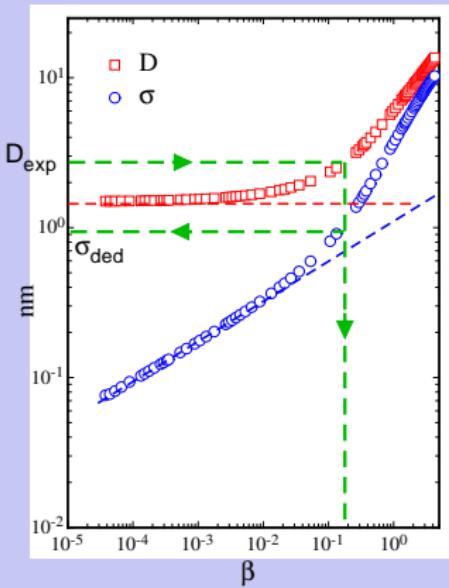

$$\mathcal{H} \simeq \frac{1}{2} \kappa \int d\mathcal{S} (\Delta u(x, y))^2$$

in an external potential $\mathcal{U}(z)$

- Symmetrical potential : Helfrich repulsion (*Z. Naturforsch.* **1978**) $\mathcal{U}_{Helf} \simeq \frac{(k_B T)^2}{\kappa} \frac{1}{d^2}$
- Asymmetrical potential in large fluctuations regime : renormalisation theory (S. Leibler et al *PRL* **(1986)**).
- Asymmetrical potential in small fluctuations regime : self-consistent approach (with K. Mecke)

$$z \text{ and } \sigma \text{ controlled by } \beta = \frac{(k_B T)^2}{A \kappa}$$

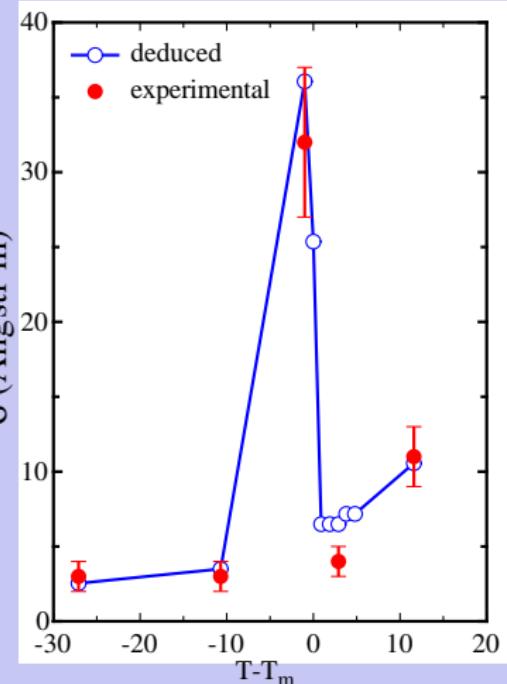

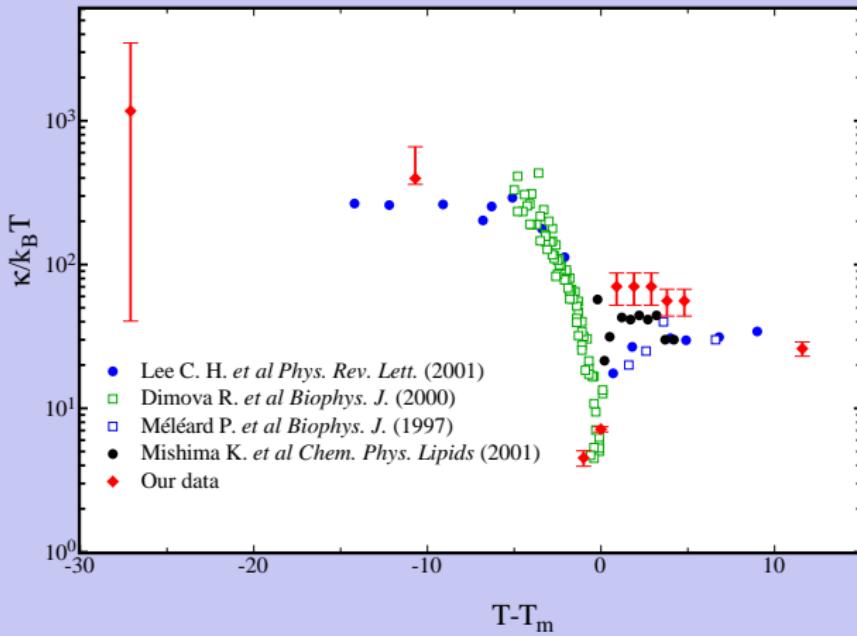

$$D_{exp} \Rightarrow \beta \Rightarrow \kappa$$

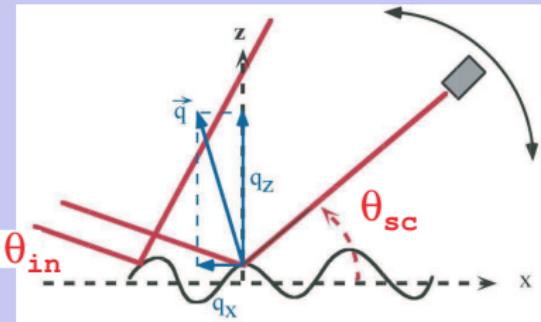

↓

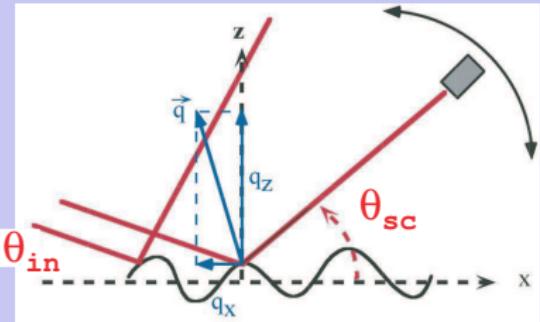

$$\sigma_{exp} \Leftrightarrow \sigma_{deduced}$$

Comparaison σ_{exp} vs $\sigma_{deduced}$

$$\frac{d\sigma}{d\Omega} = \frac{d\sigma}{d\Omega \text{ spec}} + r_e^2 |t_{0,1^{in}}|^2 |t_{0,1^{sc}}|^2 \left\langle \left| \int d^3\vec{r} \delta\rho(\vec{r}) e^{i\vec{q}\cdot\vec{r}} \right|^2 \right\rangle$$

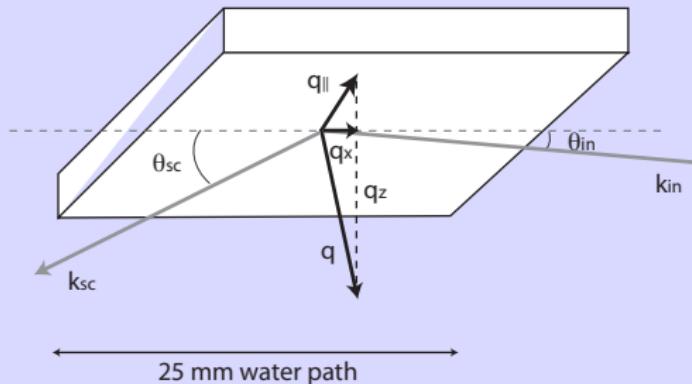

$\langle \delta\rho(r)\delta\rho(r') \rangle \stackrel{?}{\leftrightarrow}$ holes, protrusion, domains, ripples, fluctuations... ?

thermal fluctuations spectrum :

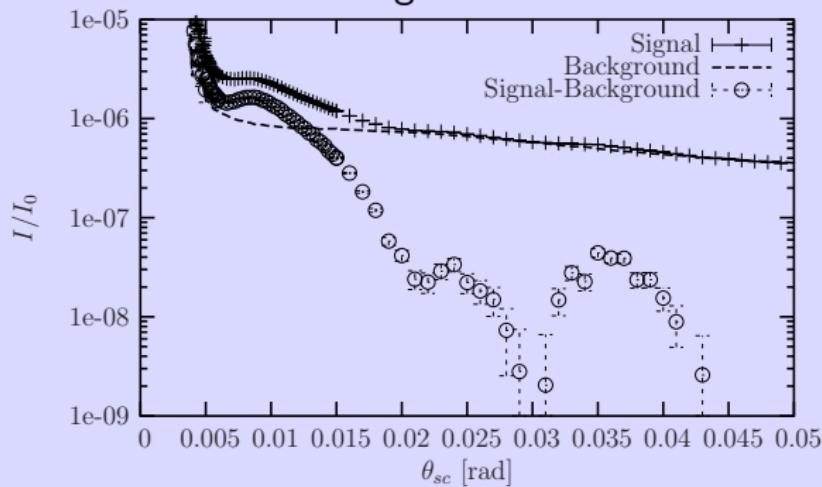

$$\langle \zeta(q_{||})\zeta(-q_{||}) \rangle = \frac{k_B T}{A + \gamma q_{||}^2 + \kappa q_{||}^4}$$

- ESRF, BM 32, 20 keV ($\lambda = 0.62\text{\AA}$)
- Si substrate
- incidence angle $\Theta_i \simeq 1 \text{ mrad} \lesssim \Theta_c$ to limit diffusion by substrate

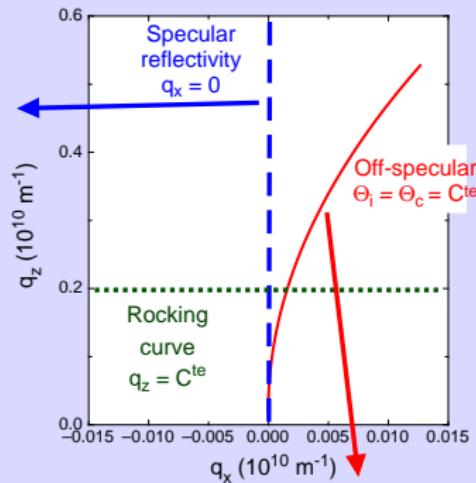

- ESRF, BM 32, 20 keV ($\lambda = 0.62\text{\AA}$)
- Si substrate
- incidence angle $\Theta_i \simeq 1 \text{ mrad} \lesssim \Theta_c$ to limit diffusion by substrate

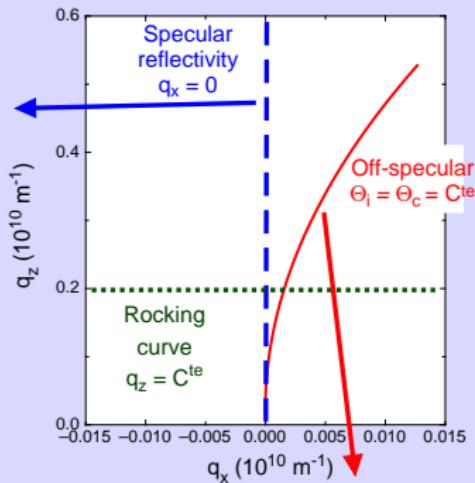

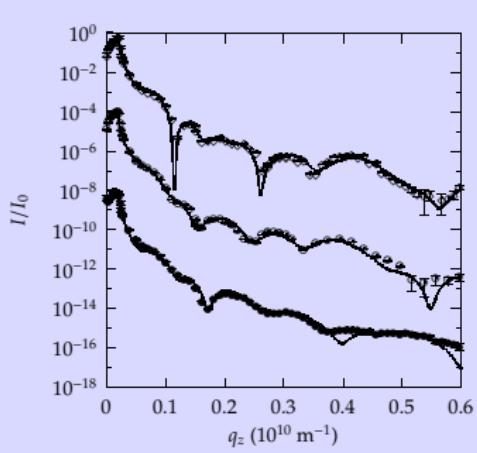

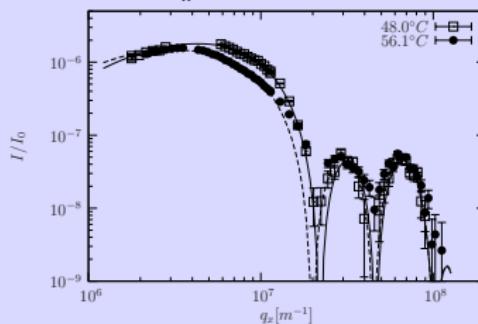

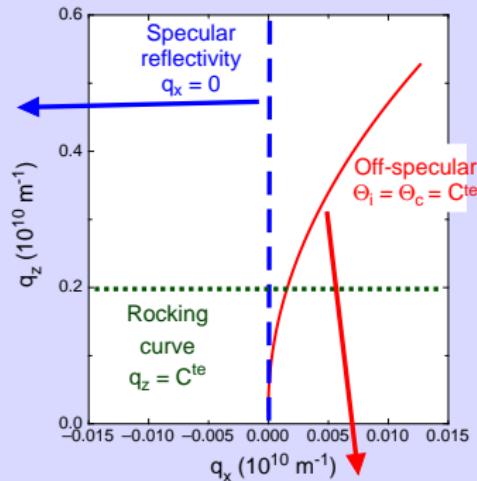

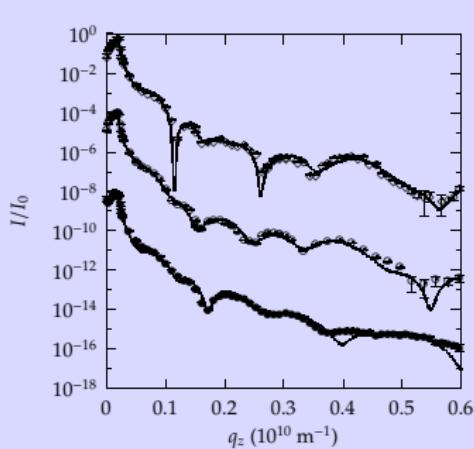

diffusion by bulk larger than diffusion by bilayer
 \Rightarrow difficult background subtraction

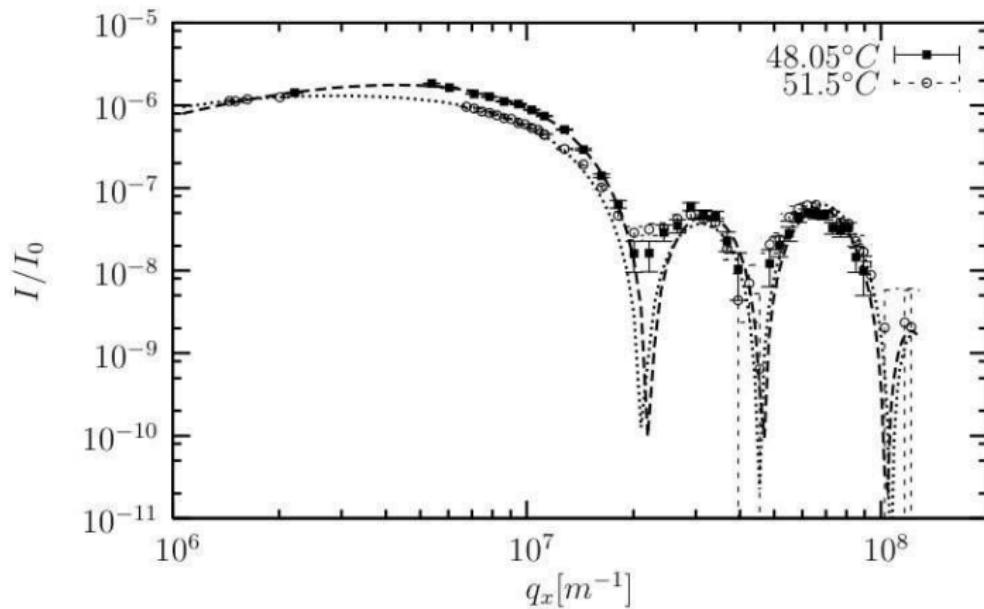

$$I_B(\theta_{sc}) = [I_{sl}(\theta_{sc}) + R(\theta_{in}) \times I_{sl}(\theta_{sc} - 2\theta_{in})] / 2$$

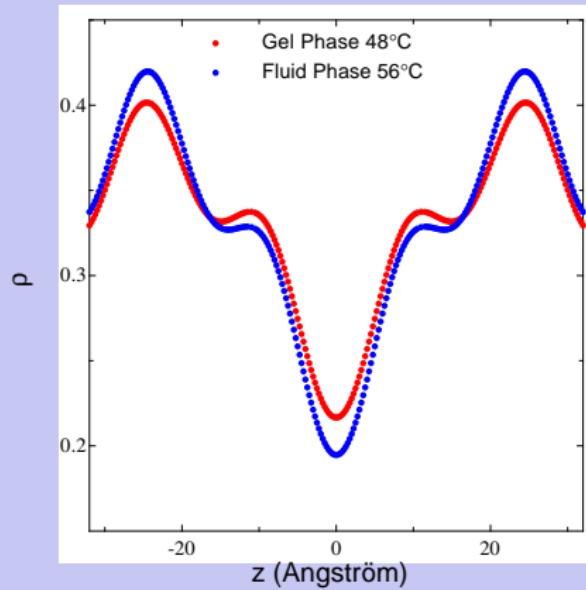

Off-specular experimental results

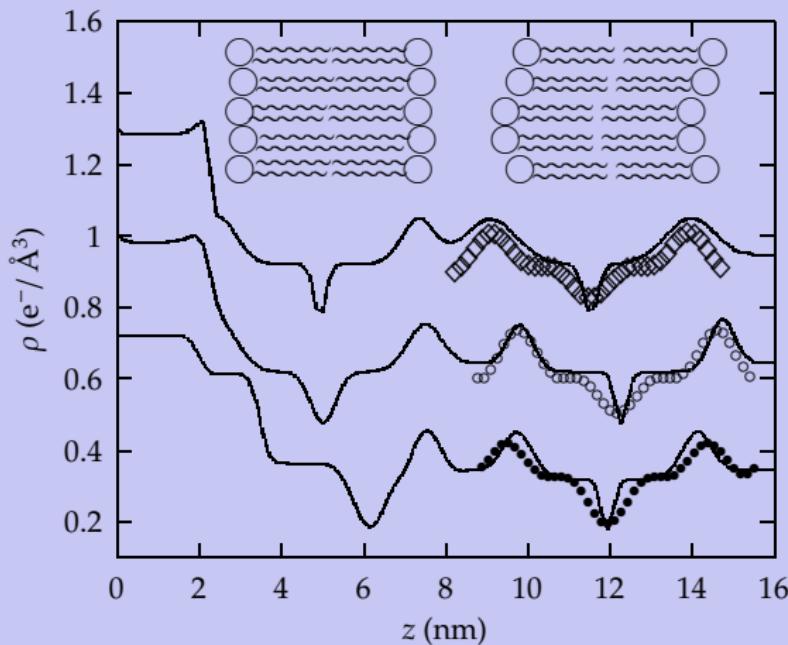

Only sensitive to second bilayer electronic density profile

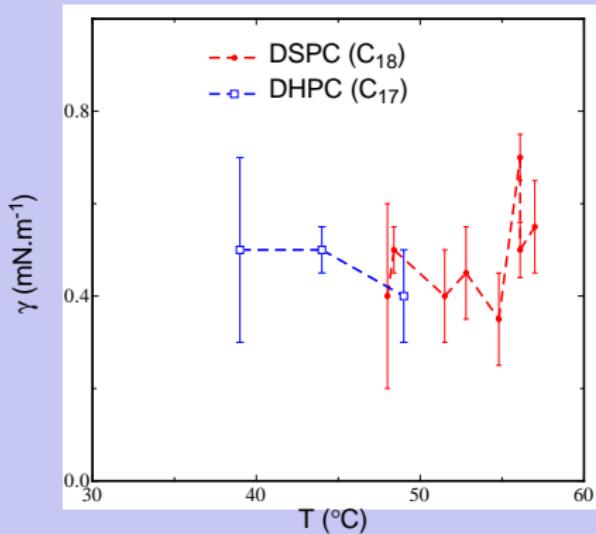

4 first Fourier coefficient

$$\Rightarrow \rho(z) - \rho_w = \frac{F_0}{D} + \frac{2}{D} \sum_{h=1}^{h_{\max}} F_h \cos \left(\frac{2\pi h z}{D} \right)$$

Coherent with specular reflectivity

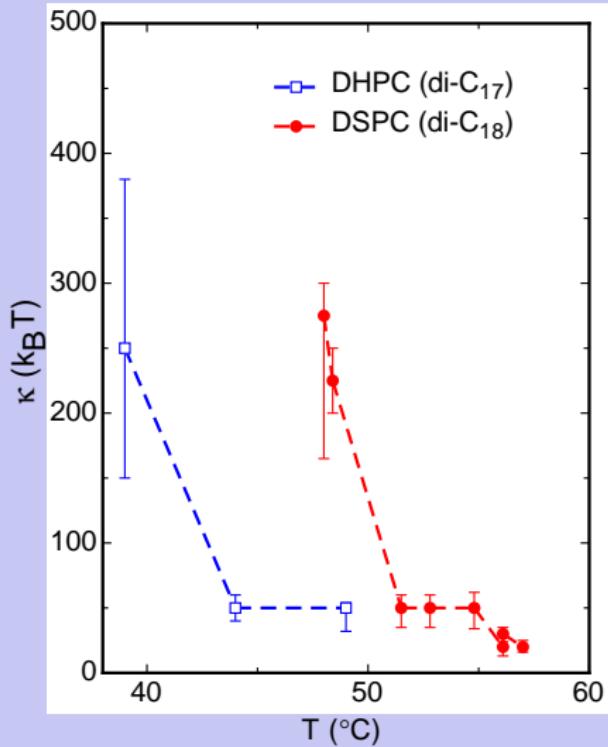

surface tension roughly constant $\sigma \simeq 0.5 \pm 0.2 \ mN.m^{-1}$

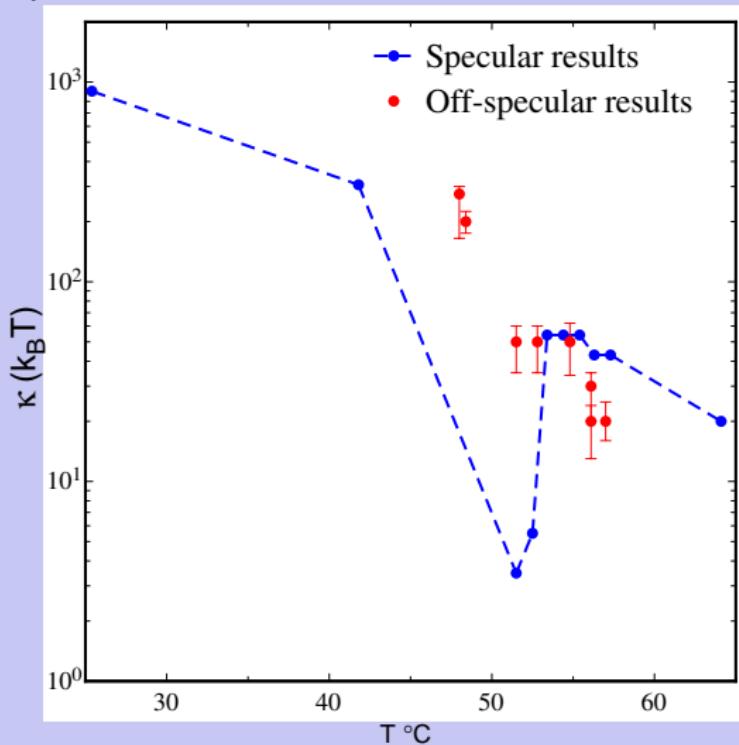

- Larger than for vesicles $\sigma \sim 10^{-5} \ mN.m^{-1}$ (Pécreaux et al)
- Smaller than lysis tension $\sigma_L \sim 5 - 10 \ mN.m^{-1}$

absolute measurement of bending modulus in Gel and Fluid phases

Comparison with value from self-consistent theory

Conclusions

- well controlled (composition, position) *free* supported bilayer
- Off-specular reflectivity : powerful tool to study single bilayer
- Direct measurement of Structure and Fluctuations spectrum
 $1.2 \cdot 10^6 m^{-1} < q < 1.2 \cdot 10^8 m^{-1}$
(Pécreaux et al $0.5 \cdot 10^6 m^{-1} < q < 7 \cdot 10^6 m^{-1}$)

Perspectives

- precise off-specular study around main transition ;
- going to smaller q to investigate bilayer-substrate interaction ;
- out of equilibrium fluctuations : bilayer under electric field...
